

Change Log — for the staging push (2026-08-11)

Everything that changed since the previous staging pack (2026-07-31), grouped by whether IT needs to act on it.
Source of truth: branch `it-after-changes-2`.

1. Backend / database changes (action required)

1.1 Per-نشاط data model — migration `0011_item_activities`

The biggest functional change: **the child unit of every stream is now a full record of its own**. In every entry form, each نشاط (ops/strategy) or خدمة فرعية (services) carries its own القطاع/الإدارة/القسم، الأتمتة، المصفوفة / ops/strategy or خدمة فرعية (services) carries its own القطاع/الإدارة/القسم، الأتمتة، المصفوفة — added via «إضافة نشاط», one complete section per child.

DB impact: - New nullable column `items.activities (JSONB)` — migration `0011_item_activities` (`ALTER TABLE "items" ADD COLUMN "activities" JSONB`). Zero-risk: additive, no backfill needed. - Shape: JSON array of `ActivityDetail` (defined in `lib/domain.ts`): { name, sector, dept, section, isAutomated, automationLevel, automationSystem, automationPct, importance, usageIntensity, readinessLevel, impactScore, transformScore, outputClarity, riskLevel, complexity, transformYes, notes } — each stream uses its own subset. - **Compatibility rule (important):** the legacy flat columns (`sub_activities` , `sub_service` , `sector` , `dept` , `section` , automation and matrix columns, `transform_priority` ...) are **kept and mirrored from the FIRST activity** on every save (`mirrorActivities` in `lib/domain.ts`); names of all activities are joined into `sub_activities` / `sub_service` . Old records without `activities` are synthesized into sections on the fly (`itemActivities`). Nothing breaks for existing rows, reports, or queries that read the flat columns. - Derivation: أولوية التحول is computed **per activity** (strategy: matrix band — لا → منخفضة; services: priority 4 → لا; ops: manual yes/no). The flat `transform_priority` mirrors «نعم» if ANY activity is نعم.

To apply on staging: `npx prisma migrate deploy` (now runs 0001 → 0011) then `npx prisma db seed` as usual. Verified on a fresh PostgreSQL 16: all migrations apply cleanly, seed unchanged and idempotent.

1.2 RBAC seed correction (from the 2026-07-31 pack — re-listed for completeness)

- `entity_representative` no longer holds `items:approve` / `items:reject` — **stream_owner** (رئيس المسار ونائبه) is the sole ent1 approver, matching the client. On an EXISTING database re-running the seed does NOT remove already-granted rows — run once: `sql DELETE FROM role_permissions rp USING roles r, permissions p WHERE rp.role_id = r.id AND rp.permission_id = p.id AND r.code = 'entity_representative' AND p.code IN ('items:approve','items:reject');` (Fresh staging databases seeded from this pack are already correct.)

1.3 service_catalog (unchanged since 2026-07-31, listed as context)

- `service_catalog` table + `GET /api/svc-catalog` (entity-scoped) — migration `0010`. No further change.

2. Bulk upload / Excel semantics (behavioral change, no DB action)

- **Template:** one row per `نشاط/خدمة فرعية`. The main entry's cells (`العملية الرئيسية / المهمة / الخدمة +`) repeat on each of its rows. Ops/strategy columns renamed: `اسم النشاط الفرعي` / `اسم`. `النشاط`.
- **Import:** consecutive rows sharing the same header identity (ops: `title+الدعم` — strategy: `التصنيف+نوع`) fold into ONE entry with `activities[]`. Row values are normalized like the form (conditional fields cleared, automation clamped `أولوية التحول` 95≥100/جزئياً derived) and incomplete rows keep importing as «بيانات ناقصة» drafts, with the missing fields named `نشاط`.
- **Excel report** (تحميل التقرير): also one row per `نشاط` with per-activity values and its own `أولوية الاختيار` — report and template are now the same shape.

3. Calculations (client logic — no DB action)

- KPI strips count **activities**, not parent entries (المستهدف تحويلها), the `القابلة للتحويل`, and the priority boxes in strategy/ services).
- `المستهدف تحويلها` / `القابلة للتحويل` on the committee/recap cards: an entry qualifies when ANY of its activities qualifies.
- `أولوية الاختيار` in the list and `دفعات` tables shows the distinct set across activities (e.g. «الأولوية 1, 2»).
- **Filter fix:** the per-stream dropdown filters (`الأولوية`, `المحور`, `الخدمة`, `القطاع`, `نوع عملية الدعم`, `التصنيف`) were not applied to the list table — now enforced; priority/sector filters match if ANY activity matches.

4. UI-only changes (no backend action)

- «إضافة يدوية» auto-scrolls to the addition form; «إضافة نشاط» scrolls the new section into view.
- The onboarding guide no longer auto-starts on first sign-in — it opens only from «فتح الدليل» (card retitled «إرشادات استخدام المنصة»).
- «السابق» button removed from the addition form.
- «السياسات العامة» removed from `نوع عملية الدعم المؤسسي` (10 functions).
- Sign-in lands directly on the platform (team-setup screen removed); `المسار` gets the `المسار` selector in the admin add-user modal.
- Public site: «من نحن» → «عن المشروع»; timeline milestone photos (2017, 2026); committee dashboard section subtitles removed; per-stream nav submenus; batch-move dropdown removed from the tables.

5. What did NOT change

- Approval workflow (`مُعتمد/للتعديل` → `قيد الاعتماد` → `مسودة`, `approver` = `رئيس المسار` ونائبه, approved entries locked) — unchanged.

- Roles, provisioning (central admin), sessions, auth — unchanged.
- All other tables, endpoints and the notification matrix — unchanged.
- Env vars and deployment steps — unchanged (see `DEPLOYMENT.md`).
